

## Fall Protection **CalCIMA Spring Thaw 2019**

**Jack Donnelly** Los Angeles, CA

2/26/2019

### 3M Fall Protection

**DBI-SALA & Protecta Brands** 

#### Field support:

Los Angeles: Jack Donnelly; jdonnelly@mmm.com; (310) 422-7524

San Diego: Mike Murphy; <a href="mmurphy@mmm.com">mmurphy@mmm.com</a>; (949) 698-8861

Bay Area: Chris Vanover; <a href="mailto:cvanover@mmm.com">cvanover@mmm.com</a>; (714) 307-3638

Northern CA: Marc Ipsen; maipsen@mmm.com; (209) 351-8093

Orange County Training Center- Tustin, CA

-Fall Protection, Confined Space, Rescue courses

### Active vs. Passive Fall Protection

#### Active

Fall Arrest

Fall Restraint

Work Positioning

#### **Passive**

Guardrails

Handrails

Netting

**Hole Covers** 

Warning Signs

## ABCs of Active Fall Protection

A- Anchorage System

**B- Body Support (Harness)** 

**C- Connecting Devices** 

D- Descent & Rescue/ Dropped Objects

E- Education

## Inspections

#### Frequency

- -Prior to each use by Authorized Person
- -Twice annually by Competent Person (documented)

#### **Inspection Components:**

- -Webbing
- -Stitching
- -Labels
- -Hardware (D-Rings, metallic components, plastic components, etc.)
- -Snaphooks & Carabiners
- -and more...

## Anchorage System

Definition: secure point of attachment for lifelines, lanyards, or deceleration devices

Non-Certified Anchorage strength requirements

- -5000 lbs. Fall Arrest
- -3000 lbs. Work Positioning
- -1000 lbs. Restraint

#### Certified (Engineered) Anchorage

-designed, installed, and used under the supervision of a Qualified Person as part of a complete personal fall arrest system which maintains a safety factor of at least two times maximum anticipated force

## **Body Support**

Harnesses distribute fall forces over the upper thighs, pelvis, chest, and shoulders

Provides connection point on the worker for the personal fall protection system

#### Desirable traits:

Fast and simple to adjust, put on, and take off

OSHA and ANSI compliant

Comfortable

## **D-Rings**

Dorsal D-Ring: Only acceptable D-Ring for fall arrest

Chest D-Ring: Ladder Climbing

Hip D-Rings: Working Positioning & Restraint

Shoulder D-Rings: Retrieval & Vertical Entry

\*One snaphook connection per D-Ring

## Harness Fit & Sizing

Should fit snugly; a loose harness may cause:

- -Bodily injury
- -Choking
- -Potential to fall out of harness

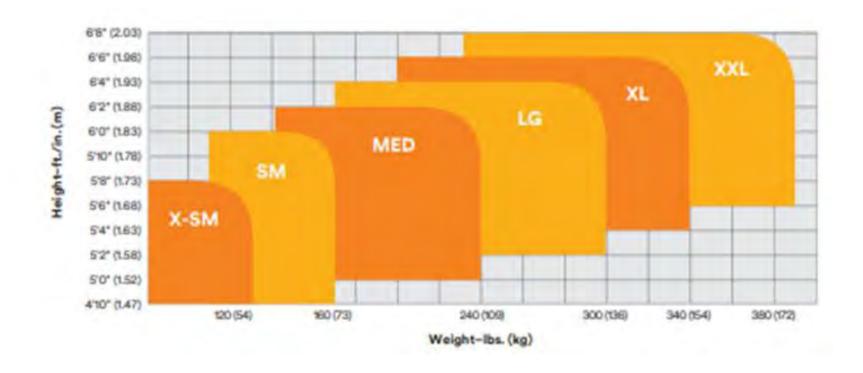

Weight capacity varies by harness

Leg straps: should be able to slide flat hand underneath, but not a fist

Dorsal D-ring: centered in between shoulder blades

DBI-SALA & Protecta harnesses: One size up

## Harness Fit & Sizing

## **Connecting Devices**

Connect a worker's harness to the anchorage system

#### Types

#### Lanyards

- -Shock Absorbing Lanyard
- -Fall Restraint Lanyard
- -Positioning Lanyard

Self-retracting lifelines (SRLs)

- -Personal SRL
- -Traditional SRL/SRD

## **Connector Components**

#### Cable/Web Line

#### Snaphooks & Carabiners

- -5000 lb. breaking strength
- -Dual action
- -Self-closing and self-locking
- -Gate strength: 3600 lbs.

#### **Energy Absorbers**

- -Max. Weight Capacity
- -Max. Free Fall
- -Max Arresting Force

## Fall Arrest Lanyards

Types

Single Leg

Twin Leg

**Shock Absorber** 

External

Internal

Avg. Length: 6 ft

-18 ft. fall clearance required

## Self-Retracting Lifelines

#### **Traditional**

-typically mounted directly overhead

-must be aware of swing fall hazards; swing fall occurs when anchorage is not located directly above worker's head

- -typically connected directly to harness
- -Single leg
- -Twin leg

## Fall Clearance Requirements

Clearance is measured from anchor point to lower level

Vary based on type of connector

SRLs can require less fall clearance than fall arrest lanyards

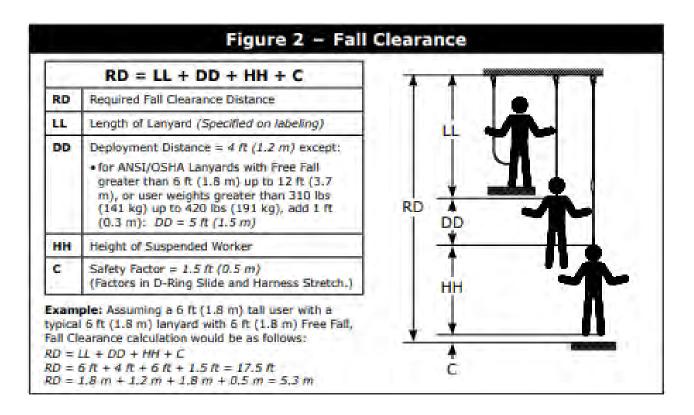

Variables affecting fall clearance:

- -anchor point height
- -lanyard length
- -deceleration distance
- -height of suspended worker
- -safety factor

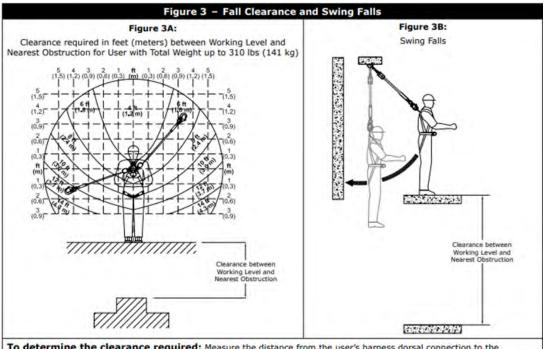

## Fall Clearance Requirements

6 ft. Fall Arrest Lanyard, anchored overhead: 17.5 ft. Clearance required

## Fall Clearance Requirements

Nano-Lok SRL, anchored overhead: 4 ft. fall clearance required

To determine the clearance required: Measure the distance from the user's harness dorsal connection to the anchorage for the Nano-Lok SRL. Both horizontal and vertical distances are required. Use Figure 3A above to determine the required clearance. The dotted lines in the figure represent 1 foot (0.3 m) increments from the user's harness dorsal connection to the anchorage. For example, 6 ft (1.8 m) of clearance is required when the Nano-Lok unit is anchored 3 1/2 ft (1 m) above and 3 1/2 ft (1 m) to the side of the user's harness dorsal connection, 12 ft (3.7 m) of clearance is required when the Nano-Lok is anchored 1 1/2 ft (0.5 m) below and 4 1/2 ft (1.4 m) to side of the user's dorsal connection.

**NOTE:** The clearances provided above assume the fall occurs from the standing position. If the worker is kneeling or crouching an additional 3 ft (0.9 m) of clearance is needed.

USERS BETWEEN 310 AND 420 LBS (141-191 kg): Users with a combined weight (person, clothing, tools, etc.) between 310 and 420 lbs (141-191 kg) need 1 ft (0.3 m) more clearance than what is shown in the Figure 3A. 310 lb to 420 lb (141-191 kg) users must never anchor the Nano-Lok more than 2 ft (0.6 m) below their harness dorsal connection.

## Leading Edge

Leading Edge: unprotected border, perimeter, or opening where a fall hazard exists

#### Unique risks:

- -Increased fall distance
- -Unpredictable lock up speed
- -Increased fall arrest forces
- -Increased potential for swing hazards
- -Potential for sharp edge to cut or damage lifeline

Leading Edge SRLs can be used for non Leading-Edge applications!

## Questions?

# Thank You!
